                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-08-726-160-22

Sequence 22, Application US/08726160

Patent No. 5734016

GENERAL INFORMATION:

APPLICANT: LEVENS, DAVID L., DUNCAN,

TITLE OF INVENTION: NOVEL FUSE BINDING

TITLE OF INVENTION: POPTEIN AND CONA THEREFOR

NUMBER OF SEQUENCES: 24

CORRESPONDENCE ADDRESS:

ADDRESSEE MORGAN & FINNEGAN

STREET: 345 PARK AVENUE

Sequence 27, Application US/08685589A

Patent No. 5916872

GENERAL INFORMATION:

APPLICANT: Chan, Jie

TILE OF INVENTION: CYCLIC PEPTIDES HAVING BROAD

TITLE OF INVENTION: SPECTRUM ANTIMICROBIAL ACTIVITY

NUMBER OF SEQUENCES: 222

CORRESPONDENCE ADDRESS: 222

CORRESPONDENCE ADDRESS:

ADDRESSED: Pennie & Edmonds LLP

STREET: 1155 Avenue of the Americas

CITY: New York

STREET: 1155 Avenue of the Americas

CITY: New York

COUNTRY: USA

ZIP: 10036

COMPUTER: READBALE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: Patent In Release #1.0, Version #1.30

CURRENT APPLICATION NUMBER: US/08/685,589A

FILING DATE: 24-UUL-1996

CLASSIFICATION NUMBER: FILING DATE:

GENERAL INFORMATION:
TITLE OF INVENTION: USE OF FURIN AND FURIN-LIKE PROTEASE INHIBITORS IN THE TREATMENT

TITLE OF INVENTION: OF INFLAMMATORY OR MATRIX REMODELLING DISEASES

TITLE OF INVENTION: OF INFLAMMATORY OR MATRIX REMODELLING DISEASES

TITLE OF INVENTION: OF OF FURIN AND FURIN-LIKE PROTEASE INHIBITORS IN THE TREATMENT

TITLE OF INVENTION: US OF FURIN AND FURING DISEASES

CURRENT APPLICATION NUMBER: US 60/213,995

PRIOR FILING DATE: 2000-06-26

PRIOR APPLICATION NUMBER: CA 2,312,109

PRIOR PILING DATE: 2000-06-23

NUMBER OF SEQ ID NOS: 3

SOFTWARE: Patentin version 3.2

LENGTH: 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ; LOCATION: (4)..(4)

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                          20, 2005, 16:30:17; Search time 37 Seconds (Without alignments) 13.327 Million cell updates/sec

J. Bacteriol. 172:6797-6802(1990).
-!- FUNCTION: Acyl-protein synthetase activates tetradecanoic acid. It is a component of the fatty acid reductase complex responsible for converting tetradecanoic acid to the aldehyde which serves as substrate in the luciferase-catalyzed reaction.
-!- CATALYTIC: ATTY TYPT: ATP + an acid + protein = AMP + diphosphate + an acyl-protein thiolester.
-!- PATHWAY: Bioluminescent fatty acid reduction system; second step.
-!- SIMILARITY: Belongs to the luxE family. 01-MAR-1992 (Rel. 21, Created)

AT The expansion behaviour of sea anemones may be coordinated by two for inhibitory neuropeptides, Antho-KAamide and Antho-RIamide.";

Proc. R. Soc. Lond., B. Biol. Sci. 253:188(1993).

CC Groups. May be involved in the expansion phase of feeding behaviour in sea anemones.

CC Dehaviour in sea anemones.

CC -I- FUNCTION: Inhibits spontaneous contractions in several muscle groups. May be involved in the expansion phase of feeding cc behaviour in sea anemones.

CC -I- TISSUE SPECIFICITY: Neuron specific.

DR PIR; JO1273; JO1273.

KW Amidation; Direct protein sequencing; Neuropeptide.

MOD RES I 1 3-phenyllactic acid.

-!- MISCELLANBOUS: These peptides are released from mast cells in lung (and other tissues) during hypersensitivity reactions (anaphylaxis). Their activities, preferentially affecting eosinophils, include chemotaxis, chemotactic deactivation, release of enzymes, and stimutation of the hexose monophosphate shunt. GO; GO:0006935; P:chemotaxis; IDA. GO; GO:0006955; P:immune response; IDA.

The invention relates to a fusion agent (Trojan antigen, TA) comprising a transport domain, two cleavage sites, a peptide epitope recognised by an antigen specific receptor on an effector T-lymphocyte precursor cell and a biologically active agent, where there is a cleavage site between the peptide epitope and the biologically active agent and between each biologically active agent. The fusion agent is used to make a cell immunogenic or antigenic. It is also useful for preventing and treating an infectious disease such as viral, bacterial, protozoal, fungal or clear disease, or proliferative disease such as cancer (e.g. melanoma, neural tissue, gastrointestinal, breast, lung, ovarian, testicular, prostate, cervical, bladder, vaginal, liver, renal, bone, haematological or vascular tissue cancer). The invention is used as vaccines. The present sequence is furin cleavable linker peptide. This peptide is used in the exemplification of the invention

Use of a convertase inhibitor in the manufacture of a medicament for reducing scarring during the healing of wounds or reducing fibrosis in the treatment of fibrotic conditions.

Example; Page 28; 43pp; English

The present sequence is that of a furin inhibitor peptide. This was used in an example from the invention which showed that furin-like enzymes are involved in platelet-mediated latent transforming growth factor-beta (TGF-beta) activation. The inventors have established that convertase enzymes cutivation of latent transforming growth factor-beta (TGF-beta) in the extracellular space at the site of a wound of a fibrotic conditions.

Thus, the present invention relates to use of convertase inhibitors for the reduction of scarring during the healing of wounds, for reducing fibrosis in the treatment of fibrotic conditions, for reducing fibrosis in the treatment of fibrotic conditions, for reacting wounds to prevent scar formation, for preventing scarring of the eye, nervous fibrotic condition is a fibrotic discate such as glomerulonephritis, cirrhosis of the liver, fibrotic discase, adhesions and restenosis (all fibrotic condition) as a fibrotic discase, adhesions and restenosis (all fibrotic condition) as a fibrotic discase, adhesions and restenosis (all cirrhosis of the liver, fibrocytic discase, adhesions and restenosis (all carring in the pelvis in the region of the fallopian tubes leading to infertility, scarring following injury to the muscles, scarring or scarring in the pelvis in the region of the fallopian tubes leading to serious loss of function, liver fibrosis, pulmonary fibrosis, contaction, central nervous system fibrosis, pulmonary fibrosis, contaction, central nervous system fibrosis following myocardial hiserables. neurodegenerative disorders (e.g. Alzheimer's disease), proliferative vitreoretinopathy, arthritis, arteriosclerosis and cancer.

                                                                                                                    Peptide used to determine substrate specificity of an endo-type protease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes an endo-type cysteine protease that has substrate specificity and cleaves the C terminus side of the sequence of Lys-Arg and Arg-Arg. The enzyme has the molecular weight of 72,000 based on SDS-PAGS and an isoelectric point of 5.22. The endo-type cysteine protease is obtained from cod fish milt. The enzyme is used in food and beverage products and pharmaceuticals. The present sequence represents a peptide used to determine specificity of the enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Novel assay for identifying modulators of sterol-regulated Site-1 protease useful for the treatment of hypercholesterolemia, involves identifying an agent capable of down regulating Site-1 protease activity.
                                                                                                                                                                                                                                                     The specification describes a method for identifying modulators of a sterol-regulated Site-1 protease. Site-1 protease cleaves sterol regulatory element binding proteins (SREBPs) in the endoplasmic reticulum, initiating release from membranes and activating lipid synthesis. The modulators therefore also modulate cholesterol and fatty acid blosynthesis. The method comprises selecting an agent capable of down regulating Site-1 protease and formulating a composition comprising the agent. The site-1 protease and formulating a composition comprising the agent. The site-1 protease inhibitors are useful for treating a patient for elevated serum cholesterol. Diseases treated include hypercholesterolemia and other lipid metabolism associated conditions. The present sequence was used in the course of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Site-1 protease, SIP, sterol regulatory element binding protein, SREBP, fatty acid synthesis, cholesterol homeostasis, triglyceride.

                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                              The present invention describes a number of peptide derivatives which are capable of modulating Site-1 protease (SIB). SIP initiates the release sterol regulatory element binding proteins (SRBBBs), which control the synthesis of fatty acids and cholesterol. The peptide derivatives of the invention are, therefore, useful in the modulation of cholesterol homeostasis and in the treatment of conditions associated with abnormal levels of plasma cholesterol, lipoproteins or triglycerides. The present sequence is a peptide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Site-1 protease; SIP; sterol regulatory element binding protein; SREBP; fatty acid synthesis; cholesterol homeostasis; triglyceride.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                              for modulating

The present invention describes a number of peptide derivatives which are capable of modulating Site-1 protease (S1P). S1P initiates the release of sterol regulatory element binding proteins (SREBPS), which control the synthesis of fatty acids and cholesterol. The peptide derivatives of the invention are, therefore, useful in the modulation of cholesterol homeostasis and in the treatment of conditions associated with abnormal levels of plasma cholesterol, lipoproteins or triglycerides. The present sequence is a peptide substrate of S1P which can be used in a fluorigenic peptide assay of S1P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transporter peptide; therapy; colon cancer; neurodegenerative disorder; diabetes; respiratory ailment; cardiplegia; viral infection; cytostatic; virucide; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                Peptide derivatives, useful as S1 protease inhibitors for modulating expression of genes regulated by SREBP transcription factors and for treating conditions associated with abnormal cholesterol or lipid

Claim 17; Col 11; 16pp; English

```
The invention comprises alpha-amino acid and peptidyl compounds having a C-terminal imidazolesulfonylmethylane group which is a serine protease. inhibitor. The compounds of the invention are capable of interacting with the substrate recognition site of a serine protease. The compounds of the invention are useful for the treatment of diseases characterised by overactivity of one or more serine proteases, e.g. respiratory distress syndrome, septic shock; multiple organ failure; emphyseems; myocardial ischemia; reperfusion injury; dermatitis; cystic fibrosis; chronic bronchitis; arteriosclerosis; Alzheimer's diseases, corneal ulcers; rheumatodid arthritis and acute pancreatitis. The present amino acid sequence represents the furin (serine protease) substrate peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel protein for inducing apoptosis, has proneurotrophin pro-domain with conserved regions, mature neurotrophin domain, and connector that joins conserved region to mature domain and resistant to protease cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated protein comprising a pro-domain (PD) of a proneurotrophin, where PD comprises a pro-domain conserved region, or a modified proneurotrophin protein (Ib) with a PD, a mature neurotrophin domain (MD), and a connector that joins the pro-domain conserved region to MD and resistant to protease cleavage. The PD is selected from specific peptide fragments of human nerve growth factor (NGF), human brain derived neurotrophic factor (BDNF), human neurotrophin 3 (NT-3) or human neurotrophin 4/5 (NT4/5). (ID) is useful for inducing apoptosis in a cell comprising PJS receptors (normal number or higher than the normal number of PJS receptors) on its surface, by causing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 growth factor; NGF; neurotrophin; NT-3; NT4; NT5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ઠે
                                                                                                                                                                                                                                                                      effector into the cytoplasm and nucleus of a cutaryotic cell preferably a human cell. They are also useful for increasing the intracellular concentration of an effector within a cutaryotic cell, preferably human cell. Transporter peptides of the invention are useful for transporting an effector across a biological membrane, for targeting various cell an effector across a biological membrane, for targeting various cell for increasing the biological activity of the effector to which it is coupled. Pharmaceutical compositions comprising the transporter peptides are useful for treating or preventing diseases such as colon cancer, diabetes, respiratory aliments, neurodegenerative disorders, cardiplegia and viral infections. The present sequence is a transporter peptide of the invention. This peptide can be translocated across a membrane of lung

reversible. This sequence represents a fluorescent substrate peptide used in the creation of first generation eglin c variants of the invention.
                                                                                                                                                                              exposed
                                                                                         further comprising a least one non-naturally occurring and no acid in a reactive loop. The novel composition is useful for treating disease including acute bacterial (e.g. Bacillus anthracis, Corynebacterium diptheriae, and Pseudomonas aeruginosa), viral (respiratory syncytian) virus, measles virus, and human immunodeficiency virus) and fungal (candidiasis and pneumcoystis pneumonia) infections in a patient exposed to an infectious agent. The eglin c variants are useful for blocking endoproteolytic activation of a bacterial toxin including anthrax toxin protective antigen, diphtheria toxin, Pseudomonas aeruginosa exotoxin A purification reagents, as fluorescence tags for identification of cells containing target proteases, for subcellular localisation of proteases, and for tracking internalisation of drugs and for examining and
                                                                                                                                                                                                                                                                                                             inhibiting physiological functions of processing or other proteases in cell cultures or in transgenic animals, for example by selectively inhibiting the enzymes. The eglin c variants are small, stable and

The present invention describes a compound (I) comprising a molecular adjuvant linked to a nicotine hapten. The molecular adjuvant comprises a targeting ligand having binding affinity for an antigen presenting cell.

The targeting ligand is functionally linked to the nicotine hapten so that the binding of the molecular adjuvant to the antigen presenting cell and effecting delivery of the nicotine hapten to an antigen presenting pathway. Also described is a method for the preparation of antibodies to a nicotine hapten comprising an antimal with (I); (b) isolating antibodies from the sera of the animal; and (c) recovering the isolated antibodies from the sera of the animal; and can be used in vaccines. (I) can be used for the treatment or prevention of nicotine addiction via immunisation with a nicotine vaccine. The compound (I) is capable of causing smoking cessation and long term compound (I) is capable of stimularization with an incotine vaccine; necompound (I) is capable of stimularization with an incotine antigen to antigen presenting cells (APCS), and so inducing an anti-nicotine antibody response with little or adjuvants. The present sequence is used in the exemplification of the
targeting ligand linked to nicotine hapten.

New multimeric transporter peptides, useful for treating diabetes, colon cancer, respiratory ailments, neurodegenerative disorders, cardiplegia, and viral infections

Claim 3; SEQ ID NO 29; 49pp; English.

The present invention describes a multimeric transporter peptide (I)

```
Also described: (1) a transporter unit comprising the transporter peptide and an effector; (2) translocating the transporter unit across the membrane of pancreatic beta-cells, hepatocytes, muscle cells or lung cells; (3) a pharmaceutical composition comprising the transporter unit and a carrier; (4) a method of producing a translocatable conjugate between the transporter peptide and an effector; (5) a method of increasing the intracellular concentration of an effector with a charmaceutical composition described above; and (7) a method of treating or preventing a disease. (1) has antidiabetic, cytostatic, or preventing a disease. (1) has antidiabetic, cytostatic, antiinflammatory, nootropic, neuroprotective and virucide activities, and can be used in gene therapy. The multimeric transporter peptide (1), compositions and methods of the present invention can be used for treating diabetes, colon cancer, respiratory ailments, neurodegenerative disorders, cardioplegia, and viral infections. The present sequence represents a peptide which can be used as part of a multimeric
                                                                                                                                                                                                                                                                                                                                       ö

manufacture of a medicament for of wounds or reducing fibrosis in Use of a convertase inhibitor in the reducing scarring during the healing the treatment of fibrotic conditions.

Disclosure; Page 10; 43pp;

The present sequence is that of a peptide fragment of alpha-1-antitrypsin. Convertase inhibitors of the invention may be derivatives of alpha-1-antitrypsin comprising this sequence. The inventors have established that convertase enzymes act, both extracellularly and intracellularly, to cause the activation of latent transforming growth factor-beta (TGF-beta) in the extracellular space at the site of a wound

```
convertage inhibitors for the reduction of scarring during the healing of wounds, for reducing fibrosis in the treatment of fibrotic conditions, correctating wounds to prevent scar formation, for preventing of the treating wounds to prevent scar formation, for preventing of the eye, nervous tissue or intestines, dermal scarring and scarring of following a burn. The fibrotic condition is a fibrotic disease, achesions glomerulonephritis, cirrhosis of the liver, fibrocytic disease, achesions and restenosis (all claimed). The convertase inhibitor can also be used for the treatment of hypertropic and keloid scars, scarring in the heart, scarring of the gut, scarring in the pelvis in the region of the carring of the gut, scarring in the pelvis in the region of the muscles, scarring or fibrosis following injury to the which can result in serious loss of function, liver fibrosis, pulmonary fibrosis, scleroderma, myocardial hibernation, fibrosis following a stroke or neurodegenerative disorders (e.g. Alzhaimer's disease), proliferative vitreoretinopathy, arthritis, arteriosclerosis and cancer.
fibrotic conditions. Thus, the present invention relates to use of

Heterologous polypeptide factor prepn. - by introducing into polypeptide factor dependent host cell nucleic acid, and then culturing host cell,

Example; Page 56; 134pp; English.

The inventors describe the production of mammalian cells expressing prohormone convertase which facilitates the processing of prohormone precursors to active hormones. More specifically the cleavage site is the prohormone convertase cleavage site given in AAR37612-35. A human proinsulin mutant having a non-naturally occurring prohormone convertase cleavage site is constructed by mutating the human proinsulin cDNA, pRK.proins encoding the natrually occurring basic cleavage site at the B-

The product was ligated in plasmid pRKS and called pRK.proins. Mutants of the prohormone convertase (PC) cleavage site in the human preproinsulin were constructed (AAAK60591-5) The mutated sites are specifically recognised by murine PC1. The new cleavage sites are labelled either Ip or IIp. Ip is a Type I enzyme cleavage site whereas IIp is a Type II enzyme cleavage site. Cells containing both the prohormone convertase gene and the required precursor gene e.g preproinsulin to be expressed can be injected into a mammal. This system can be used to treat insulin-responsive disorders. (Updated on 25-MAR-2003 to correct PN field.)
               (AAR3/628) by site-directed mutagenesis (Kunkel 1987). The following proinsulin variants were constructed: proins.RTKR.Ip, proins.RQKR.IIp and proins.KTKR.Ip (see AAR3/629-31). The following double proinsulin variants were constructed: proins.KR.Ip/RQKR.IIp and proins.RTKR.Ip/RQKR.IIp. Primers used in proninsulin mutant construction were AAQ43265-67. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating insulin-dependent disorders in mammals - by introducing a nucleic acid encoding a variant proinsulin into a host cell with a constitutive pathway of protein secretion, or a plasmid, and introducing the cell or plasmid to the mammal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 2
US-08-002-202-20
| Sequence 20, Application US/08002202
| Patent No. 5604201
| GENERAL INFORMATION:
| APPLICANT: Thomas, Garry
| APPLICANT: Thomas, Laurel
| APPLICANT: Thomas, Laurel
| APPLICANT: Thomas, Laurel
| TITLE OF INVENTION: Methods and Reagents for Inhibiting
| TITLE OF INVENTION: Purin Endoprotease
| NUMBER OF SEQUENCES: 21
| CORRESPONDENCE ADDRESS:
                                                                                                                                                                                               US-08-002-202-4

Patent No. 6022855

GENERAL INFORMATION;
APPLICANT: Thomas, Gary
APPLICANT: Thomas, Laurel
APPLICANT: Hayflick, Joel S
APPLICANT: Nelson, Jay
APPLICANT: Stenglen, Stephan G
TITLE OF INVENTION: Methods and Reagents for Inhibiting Furin
TITLE OF INVENTION: Endoprotease
NUMBER OF INVENTION: Endoprotease
NUMBER OF SEQUENCES: 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            84.2%; Score 16; DB 3; Length 4; 75.0%; Pred. Squence 8, Application US/10478179

Publication No. US20040249126A1

GENERAL INFORMATION:
APPLICANT: Cells, Esteban

TITLE OF INVENTION: CHIMERIC ANTIGEN-SPECIFIC T

TITLE OF INVENTION: CELL-ACTIVATING POLYPEPTIDES

FILE REFERENCE: 07039-277US1

CURRENT APPLICATION NUMBER: US/10/478,179
                                                                                                                                                                                                                                                                                                                                                             ALIGNMENTS

                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
